(57) **ABSTRACT**

The present invention provides a novel compound for counteracting amine-based malodor in consumer, industrial and textile products.

6 Claims, No Drawings

1

LOW VOLATILE REACTIVE MALODOR COUNTERACTIVES AND METHODS OF USE THEREOF

BACKGROUND OF THE INVENTION

Malodors are offensive odors, which are encountered in the air and on many substrates such as fabrics, hard surfaces, skin, and hair. Amines, thiols, sulfides, short chain aliphatic and olefinic acids, e.g., fatty acids, are typical of the chemicals found in and contributed to sweat, household, and environmental malodors. These types of malodors typically include indole, skatole, and methanethiol found in toilet and animal odors; piperidine and morpholine found in urine; pyridine and triethyl amine found in kitchen and garbage odors; and short chain fatty acids, such as 3-methyl-3-hydroxyhexanoic acid, 3-methylhexanoic acid or 3-methyl-2-hexenoic acid, found in axilla malodors. Compounds which have been found in the axilla are described for example by Zeng, et al. ((1991) *J. Chem. Ecol.* 17:1469-1492).

Malodor counteractants or masking agents have been described in the art. For example, sulfhydryl reactants, such as diethyl fumarate, di-n-butyl maleate and N-ethylmaleimide are disclosed in U.S. Pat. No. 5,601,809 as compounds that are effective against axillary malodor. Further, the use of certain aromatic unsaturated carboxylic acid esters in combination with alkyl fumarates as malodor counteractants is disclosed in U.S. Pat. No. 6,610,648. U.S. Pat. No. 6,403,075 addresses fragrance materials with a phenyl ring moiety as ammonia masking agents. Similarly, US 2002/0058017 describes cis-3-hexenol to mask ammonia. Moreover, U.S. Pat. No. 7,585,833 describes methods for formulating fragrances to mask malodor present in products containing ammonia and substituted amines (See, U.S. Pat. No. 6,379,658, U.S. Pat. No. 6,376,741, U.S. Pat. No. 5,769,832, and U.S. Pat. No. 5,037,412).

Although the art describes compositions and methods for neutralizing certain malodors, there still remains a need for additional compounds that are more efficient against malodors. In addition, these new materials possess very low volatility such that the overall olfactory character of the fragrance is not impacted or only to a small extent.

SUMMARY OF THE INVENTION

The present invention features a malodor counteractant compound composed of an α -keto moiety or benzaldehyde covalently attached to a polymer, an oligomer, a surfactant, or a solid surface. In one embodiment, the α -keto moiety of the malodor counteractant compound is, for example, levulinic acid, acetoacetic acid, pyruvic acid, α -ketoglutaric acid, α -ketobutyric acid, α -ketoisocaproic acid, or α -ketovaleric acid.

In some embodiments, the malodor counteractant compound has the structure:

wherein X represents O, NH, or CH₂; n represents an integer of 0 or greater; and R is a polymer, an oligomer, a surfactant or a solid surface.

In other embodiments, the malodor counteractant compound has the structure:

2

5

wherein R₁ is a polymer, an oligomer, a surfactant, or a solid surface; and R₂ is H, OH, NO₂, NH₂, SH or CH₃.

In some embodiments, the polymer is, for example, a polyol, polysaccharide, polyamine, polyacrylate, alkene oxide polymer, or block or random copolymer thereof; the oligomer is, for example, an oligosaccharide or oligomeric alkane; the surfactant is, for example, a poloxamine or an unbranched C₁₃-C₁₅ oxo alcohol; and the solid surface is, for example, a silica or clay surface.

In specific embodiments of this invention, the polymer is (a) polyalkylene oxide with OH or NH₂ end groups such as polyethyleneoxide, polypropyleneoxide, polytetrahydrofuran, polyetheramine, a block or random copolymer variant thereof such as PLURONICS or SYNERONICS, or a branched copolymer such as a TETRONIC polymer; (b) polyvinyl amine or a copolymer with vinyl formamide or vinyl acetamide; (c) poly vinyl alcohol or a copolymer with vinyl acetate, olefin such as ethylene and propylene, or acrylate; or (d) biopolymer such as polysaccharide (i.e., maltodextrin, starch, guar, xanthan, carboxymethyl cellulose, hydroxyethyl cellulose, carrageenan, or cationic/amphoteric/hydrophobically substituted polysaccharide).

Consumer, industrial and textile products containing the above malodor counteractant are also provided as are methods for producing the above malodor counteractant and using the above malodor counteractant to counteract amine-based malodor.

DETAILED DESCRIPTION OF THE INVENTION

The present invention provides compounds composed of an α -keto moiety or benzaldehyde covalently attached to a polymer, an oligomer, a surfactant (nonionic with OH, NH₂ or COOH groups), or a solid surface (silica or clay) for use as malodor counteractants. Advantageously, the α -keto moiety or benzaldehyde of the malodor counteractant compounds of the present invention respectively contain at least one ketone or aldehyde group, which is capable of binding or reacting with amine-based malodors thereby effectively reducing the concentration of these malodors in consumer, industrial or textile products. Moreover, the compounds of the present invention have a low vapor pressure such that the compounds can be added in significant quantities to products without impacting the olfactory character of the products. Given these features, the compounds of the present invention find use as additives to consumer products to reduce the concentration of malodors in the headspace of the product. Furthermore, the compounds of the present invention can be used to form a fragrance or flavor encapsulate or other delivery system such that while the delivery system is delivering its payload, malodors are removed from the air. Alternatively, the compounds of the present invention can be formulated into a product, such as a fragrance, which can be optionally formulated into a delivery system.

As indicated, particular embodiments feature compounds with low-to-no vapor pressure. Vapor pressure (P° is the pressure of a vapor of a compound in equilibrium with its pure condensed phase (solid or liquid). Vapor pressure is measured

3

in the standard units of pressure. The International System of Units (SI) recognizes pressure as a derived unit with the dimension of force per area and designates the pascal (Pa) as its standard unit. One pascal is one Newton per square meter ($\text{N}\cdot\text{m}^{-2}$ or $\text{kg}\cdot\text{m}^{-1}\cdot\text{s}^{-2}$). Vapor pressures depend on the temperature and vary with different compounds due to differences in molecule-molecule interactions. For example, vapor pressure at 25° C. of n-alkanes is a function of chain length, wherein larger n-alkane molecules have lower P° due to greater polarizability and increased strength of London Dispersion intermolecular forces. The vapor pressure of a compound can be determined by conventional methods known to those of skill in the art. In particular embodiments, compounds of the present invention have a vapor pressure of less than 200 Pa (1.5 mmHg), less than 100 Pa (0.75 mmHg), less than 50 Pa (0.375 mmHg), less than 20 Pa (0.15 mmHg), or less than 10 Pa (0.075 mmHg), at 25° C.

The α -keto moiety of the malodor counteractant compound of the present invention is, in particular embodiments, levulinic acid, acetoacetic acid, pyruvic acid, α -ketoglutaric acid, α -ketobutyric acid, α -ketoisocaproic acid, or α -ketovaleric acid. The α -keto moiety is covalently attached to a polymer, an oligomer, a surfactant, or a solid surface. Accordingly, in certain embodiments, the malodor counteractant compound of the present invention has the structure:

Formula I

wherein

X represents O, NH, or CH_2 ;

n represents an integer of 0 or greater; and

R is a polymer, an oligomer, a surfactant, or a solid surface.

The benzaldehyde of the malodor counteractant compound of the present invention is, in particular embodiments a functionalized benzaldehyde. In more particular embodiments, the benzaldehyde counteractant compound of the present invention, has the structure:

Formula II

wherein

R_1 is a polymer, an oligomer, a surfactant, or a solid surface; and

R_2 is H, OH, NO_2 , NH_2 , SH or CH_3 .

Formula II is intended to include any p-, m-, or o-functionalized benzaldehyde, wherein R_1 is a functionalization point for modulating log p and hydrogen bonding, as well as a linker to polymers, etc. In addition to a single attachment point, the $-\text{R}_1$ group can have multiple sites. These multiple attachment points can also be connected to each other in small ring systems or anchoring points on a polymer or a substrate.

A polymer in accordance with the present invention is a molecule composed of repeating monomer units. In contrast to a polymer, which can contain numerous monomers, an

4

oligomer is a molecule that is composed of a few monomer units. In this respect, oligomers include dimers, trimers, tetramers, and the like. According to the present invention, a polymer includes, but is not limited to, a polyol (e.g., polyvinyl alcohol or a copolymer with vinyl acetate, olefin such as ethylene and propylene, or acrylate); biopolymer such as polysaccharide (e.g., maltodextrin, starch, guar, xanthan, carboxymethyl cellulose, hydroxyethyl cellulose, carrageenan, or cationic/amphoteric/hydrophobically substituted polysaccharide); polyamine (e.g., polyvinyl amine or a copolymer with vinyl formamide or vinyl acetamide); polyacrylate with alcohol groups; and polyalkylene oxides with OH or NH_2 end groups, including, e.g., polyetheramine (JEFFAMINES) or block or random copolymer variant of polyethyleneoxide, polypropyleneoxide, polytetrahydrofuran (e.g., PLURONICS/SYNPERONICS). The polyalkylene oxide of the present invention is an alkyl ether having from 4 to 25, preferably 4 to 16, moles of ethylene oxide per mole of alkyl phenol (e.g., polyethylene glycol (PEG), polyethyleneoxide (PEO), polypropyleneoxide, and polytetrahydrofuran) and a block or random copolymer variant thereof or a branched copolymer such as a TETRONIC polymer.

An oligomer includes, but not limited to, e.g., oligosaccharides and oligomeric alkanes (e.g., pentanes, butanes, or hexane).

A surfactant of the present invention is a compound that lowers the surface tension of a liquid or the interfacial tension between two liquids or between a liquid and a solid. A surfactant may act as a detergent, wetting agent, emulsifier, foaming agent, or dispersant. A surfactant is usually an organic compound that is amphiphilic. Surfactants include molecules such as PLURONIC surfactants (based on ethylene oxide, propylene oxide and/or butylenes oxide as di- and tri-block copolymers) and TETRONIC surfactants (ploxamine or block copolymers based on ethylene oxide and propylene oxide with a vapor pressure of <0.1 mmHg at 25° C.) including TETRONIC 901, TETRONIC 701, TETRONIC 90R4, and TETRONIC 904, and LUTENSOL AO nonionic surfactants (unbranched C_{13} - C_{15} oxo alcohol) including LUTENSOL AO3, LUTENSOL AO4, LUTENSOL AO5, and LUTENSOL AO7.

A solid surface of the present invention includes, but is not limited to, a silica surface (e.g., a synthetic amorphous silica surface such as SYLOID), clay or other solid mineral materials with an appropriate functional group to attach the α -keto moiety. In another embodiment, the solid surface is the surface of a delivery system such as a nanoparticle, microparticle, nanocapsule or microcapsule, which attaches to one or more α -keto moieties.

In particular embodiments, the malodor counteractant compound of this invention is a small molecule with no-to-low vapor pressure attached to one or more α -keto groups or benzaldehydes. In another embodiment, the malodor counteractant compound of this invention is a polymer attached to one or more α -keto groups or benzaldehydes. In a further embodiment, the malodor counteractant compound of this invention is an oligomer with one or more α -keto groups or benzaldehydes attached thereto. In another further embodiment, the malodor counteractant compound of this invention is a surfactant attached to one or more α -keto groups or benzaldehydes. In still a further embodiment, the malodor counteractant compound of this invention is a solid surface attached to one or more α -keto groups or benzaldehydes. In particular embodiments, the malodor counteractant compound of this invention has at least one aldehyde or at least one ketone reactive group for reacting or binding amine-based malodors. In other embodiments, the malodor counteractant compound of this invention has multiple hydrogen-bonding (acceptor) sites for reacting or binding amine-based malodors.

Specific examples of malodor counteractant compounds containing a α -keto moiety of Formula I include, but are not limited to, the following examples:

Compound 1

Compound 2

Compound 3

Compound 4

Compound 5

Compound 6

7

Specific examples of malodor counteractant compounds containing a benzaldehyde of Formula II include, but are not limited to, the following examples:

Malodor counteractant compounds of the present invention are produced by covalently attaching a α -keto moiety or benzaldehyde as described herein to a polymer, an oligomer, a surfactant, or a solid surface. Given that the α -keto moiety or benzaldehyde is covalently attached, this moiety is not released before or during use in a consumer, industrial or textile product, e.g., the compounds of the present invention are not pro-fragrances. Specific examples of reagents and reactions conditions for preparing the compounds of the present invention are provided in Examples.

The malodor counteractant compounds of the present invention can be used in a variety of forms and in a variety of products. Advantageously, the compounds of the present

invention are reactive against potent malodor ingredients while not affecting the odor of a fragrance or final product. Furthermore, these compounds and the methods herein can be pursued in any situation where malodor is present. In this respect, the present invention also features a method for counteracting amine-based malodor of consumer, industrial and textile products, as well as the surrounding environment, by introducing or adding one or more malodor counteractant compounds of the present invention to a consumer, industrial or textile product so that the amine-based malodor of the product is counteracted.

9

The α -keto containing malodor counteractant compounds of the present invention may react with amine-based malodor molecules, for example, but not limited to, according to the following schemes:

Scheme 1: Schiff Base Formation

wherein X represents O, NH, or CH₂; n represents an integer of 0 or greater; R is a polymer, an oligomer, a surfactant, or a solid surface and Y—NH₂ represents an amine-based malodor molecule; and

Scheme 2: Hydrogen Bonding or Ionic Interactions:

wherein X represents O, NH, or CH₂; n represents an integer of 0 or greater; R is a polymer, an oligomer, a surfactant, or a solid surface and Y—NH₂ represents an amine-based malodor molecule.

Likewise, the benzaldehyde malodor counteractant compounds of the present invention may react with amine-based malodor molecules, for example, but not limited to, according to the following schemes:

Scheme 3: Schiff Base Formation

wherein R₁ is a polymer, an oligomer, a surfactant, or a solid surface; R₂ is H, OH, NO₂, NH₂, SH or CH₃; and X—NH₂ represents an amine-based malodor molecule;

10

Scheme 4: Charge-Ionic Pair

wherein R₁ is a polymer, an oligomer, a surfactant, or a solid surface; R₂ is H, OH, NO₂, NH₂, SH or CH₃; and X—NH₂ represents an amine-based malodor molecule; and

Scheme 5: Hydrogen Bonding with Aldehyde and/or R₂

wherein R₁ is a polymer, an oligomer, a surfactant, or a solid surface; R₂ is H, OH, NO₂, NH₂, SH or CH₃; and X—NH₂ represents an amine-based malodor molecule.

For the purposes of the present invention, a compound counteracts a malodor if it measurably (either qualitatively or quantitatively) reduces the presence of a malodor. In particular embodiments, the malodor counteractant compounds of the present invention reduce the presence of amine-based malodor of a product by 50-100% as compared to a product that does not have the malodor counteractant compounds.

Malodors particularly targeted by the compounds of the present invention include amine-based malodor such as bathroom odors, sweat, food odors, textile odors, home care and personal care product base odors, adhesive odors, and paint odors. In this respect, the compounds of the present invention can be used in air refreshers, fabric refreshers, bar soaps, perfumes, fragrances, cologne, bath or shower gels, shampoos or other hair care products, cosmetic preparations, body odorants, deodorants, antiperspirants, liquid or solid fabric detergents or softeners, bleach products, disinfectants or all-purpose household or industrial cleaners, food, or industrial or textile products such as adhesives, paints, coatings, or textiles. In yet another embodiment, one or more of the compounds of the present invention are used as part of a delivery system or polymer system to deliver a fragrance or compound of interest (e.g., a pharmaceutical).

The following are provided as specific embodiments of the present invention. Other modifications of this invention will

11

be readily apparent to those skilled in the art. Such modifications are understood to be within the scope of this invention. All reagents were purchased from Sigma-Aldrich, Inc. unless otherwise noted. Further, as used herein all percentages are weight percent unless otherwise noted, ppm is understood to be parts per million, L is understood to be liter, mL is understood to be milliliter, μ L is understood to be microliter, mol is understood to be mole, mmol is understood to be millimole, and M is understood to be moles per L. IFF as used in the examples is understood to mean International Flavors & Fragrances Inc., New York, N.Y., USA.

The invention will be further described in the following examples, which do not limit the scope of the invention described in the claims.

Example 1

Preparation of Levulinic Acid Chloride

Oxalyl chloride in dichloromethane (2 M, 450 mL, 0.9 mol) was added drop-wise to a stirring mixture of levulinic acid (100 g, 0.857 mol) and dimethylformamide (DMF, 2 mL) for about 1.5 to 2 hours at room temperature. After the addition was completed, the resulting mixture was stirred for an additional 0.5 hours. Solvents were removed in vacuo and the crude mixture was used in subsequent reactions.

Example 2

Preparation of Levulinic TETRONICS (Compound 2)

Triethylamine (6.91 mL, 49.50 mmol) was added to a stirring mixture of TETRONIC 901 (23.5 g, 24.77 mmol) dissolved in dichloromethane (150 mL) under nitrogen atmosphere at 0-5° C. Levulinic acid chloride (prepared as in Example 1) was then added drop-wise. The resulting mixture was warmed to room temperature and stirred overnight. Triethylammonium chloride salt was subsequently filtered off. The organic layer was washed with saturated Na_2CO_3 and concentrated in vacuo to afford the product levulinate TETRONIC with greater than 90% functionalization as determined by NMR spectroscopy.

Example 3

Preparation of Levulinate MALTRIN QD M585 Maltodextrin

Triethylamine (12.5 g, 0.124 mmol) was added to a stirring mixture of MALTRIN QD M585 maltodextrin (16.2 g, 0.100 mol) dissolved in DMF (60 mL) under nitrogen atmosphere at 0-5° C. The mole ratios of maltodextrin herein were based on monomer molecular structure of the entire polymeric chain. Levulinic acid chloride (prepared as in Example 1) was then added drop-wise. The resulting mixture was warmed to room temperature and stirred overnight. The triethylammonium

12

chloride salt was subsequently filtered off. Precipitate was collected with a mixture of tetrahydrofuran (THF)/isopropanol (IPA) at a volume ratio of 1:9 (THF:IPA). The solid was filtered, washed several times with the THF:IPA mixture, and dried under vacuum to afford the product levulinate MALTRIN QD M585 maltodextrin with about 15-20% functionalization as determined by NMR spectroscopy.

Example 4

Preparation of Levulinate LUTENSOL AO7

Triethylamine (11.7 g, 0.115 mol) was added to a stirring mixture of LUTENSOL AO7 (20.0 g, 57.5 mmol) dissolved in acetone (150 mL) under nitrogen atmosphere at 0-5° C. Levulinic acid chloride (prepared as in Example 1) was then added drop-wise. The resulting mixture was warmed to room temperature and stirred for overnight. The triethylammonium chloride salt was filtered off. The solvent was concentrated in vacuo to afford the product levulinate LUTENSOL AO7 with greater than 85% functionalization as determined by NMR spectroscopy.

Example 5

Preparation of Octyl Levulinate (Compound 6)

1-Bromooctane (332 g, 1.72 mol) was added to a stirring mixture of levulinic acid (200 g, 1.72 mol), tetrabutylammonium bromide (55.1 g, 0.17 mol), and K_2CO_3 (357 g, 2.58 mol) in DMF (500 mL) drop-wise and stirred at room temperature for overnight. The resulting mixture was diluted in toluene and the organic layer was washed with HCl (10%), brine, and water. The solvent was concentrated in vacuo and the oil was purified by vacuum distillation to afford the product octyl levulinate as a clear oil.

Example 6

Preparation of 4-Octyloxy Benzaldehyde

A mixture of 4-hydroxybenzaldehyde (10.0 g, 81.8 mmol), 1-bromooctane (15.8 g, 81.8 mmol), and K_2CO_3 (34.0 g, 0.25 mol) in DMF (150 mL) was heated to reflux for 8 hours and then cooled to room temperature. The reaction mixture was subsequently diluted in toluene. The organic layer was washed with HCl (10%), brine, and water. The solvent was concentrated in vacuo and the oil was purified by short silica gel plug (dichloromethane (DCM) in n-hexane, 10%). Solvent was dried in vacuo to afford the product 4-octyloxy benzaldehyde as a slightly colored oil.

Example 7

General Synthesis of Benzaldehyde Malodor Counteractant Compounds

Benzaldehyde malodor counteractant compounds can be prepared from a variety of benzaldehydes which are mono-, di-, or tri-substituted with functional groups in the p-, m-, and/or o-positions. Exemplary benzaldehyde starting materials include, but are not limited to, 4-hydroxybenzaldehyde, 4-methoxybenzaldehyde, 4-bromobenzaldehyde, 4-formylbenzonitrile, 3-methoxy-p-anisaldehyde, Vanillin, Isovanillin, Syringaldehyde, potassium 3-formylphenyltrifluoroborate, 3-chloro-4-hydroxybenzaldehyde, 3-formyl-4-hydroxybenzoic acid, 4-formylbenzoic acid, 3-fluoro-4-

13

formylphenylboronic acid, 3-allylsalicylaldehyde, 4-ethyl-3-nitrobenzaldehyde, p-formylbenzoic acid N-hydroxysuccinimide ester, 4-[(tert-butyl-dimethylsilyl)oxy]benzaldehyde.

As will be readily appreciated by one of skill in the art, a halogenated benzaldehyde can have any halogen group substituted at the same position(s). For example, 3-chloro-4-hydroxybenzaldehyde can readily be used as can 3-fluoro-4-hydroxybenzaldehyde.

Benzaldehyde malodor counteractant compounds can be prepared using one or more of the following methods.

Method 1.

Step 1 involves mono-alkylation of hydroxybenzaldehyde with di-halogenated alkane, where X is bromide, chloride, iodide. Step 2 involves conjugation of the polymer via the other halogen of the di-halogenated alkane and a hydroxy-terminated or primary amine-terminated polymer (Y-Polymer).

Method 2.

This method involves incorporation of a hydroxy-terminated or primary amine-terminated polymer (Y-Polymer) via double esterification/amidation of hydroxyl- or amino-benzaldehyde with di-acid chloride crosslinker.

14

-continued

Method 3.

Step 1 involves acid chloride formation with the carboxylic acid moiety of the benzaldehyde. Step 2 involves esterification or amidation with a hydroxy-terminated or primary amine-terminated polymer/material.

Method 4.

Step 1 involves bromination or chlorination of a primary alcohol-terminated polymer. Step includes alkylation of hydroxyl-benzaldehyde with the halogenated polymer.

Method 5.

This method involves polymerization or copolymerization of benzaldehyde functionalized monomer.

When hydrolysis stable reactive polymers, surfaces or surfactants are required, polymer/surface/surfactant can employ amide groups as their linkage. Besides using the acid chloride to create ester or amide bonds, N,N'-dicyclohexylcarbodiimide (DCC) coupling can be used to create these linkages. Moreover, esterification can be performed using any suitable acid with alkyl halides.

Example 8

Synthesis of Dibenzaldehyde JEFFAMINE ED-900

To a stirring mixture of 4-formyl benzaldehyde (10.0 g, 0.130 mol) in THF (250 mL) with catalytic amount of DMF

15

(12 mL) was added drop-wise, thionyl chloride (7.93 g, 0.130 mol) at 0° C. After the complete addition, the mixture was stirred for an additional 0.5 hour. The synthesized acid chloride was then used in-situ for the following reaction. To a stirring mixture of JEFFAMINE ED-900 (27.3 g, 30.3 mmol) dissolved in THF (200 mL) was added triethylamine (6.74 g, 66.6 mmol) under nitrogen atmosphere at 0-5° C. Acid chloride was added drop-wise to the stirring mixture. After addition, the reaction mixture was warmed to room temperature and was stirred overnight. The triethylammonium chloride salt was filtered off. The organic layer was washed with saturated Na₂CO₃ and concentrated in vacuo to afford the dibenzaldehyde JEFFAMINE ED-900 with greater than 85% functionalization as determined by NMR spectroscopy.

Example 9

Synthesis of 4-Octyloxy Benzaldehyde

A mixture of 4-hydroxybenzaldehyde (10.0 g, 81.8 mmol), 1-bromooctane (15.8 mmol, 81.8 mmol), and K₂CO₃ (34.0 g, 0.25 mol) in DMF (150 mL) was heated to reflux for 8 hours. After cooling the reaction back down to room temperature, the reaction mixture was diluted in toluene and the organic layer was washed with 10% HCl, brine, and water. After concentrating in vacuo, the oil was purified by short silica gel plug (10% DCM in n-hexanes). Solvent was dried in vacuo to afford the 4-octyloxy benzaldehyde as a slightly colored oil.

Example 10

Synthesis of 4-Octyloxy-3-nitrobenzaldehyde

A mixture of 4-hydroxy-3-nitrobenzaldehyde (10.0 g, 81.8 mmol), 1-bromooctane (15.8 mmol, 81.8 mmol), and K₂CO₃ (34.0 g, 0.25 mol) in DMF (150 mL) was heated to reflux for hours. After cooling the reaction back down to room temperature, the reaction mixture was diluted in toluene and the organic layer was washed with 10% HCl, brine, and water. After concentrating in vacuo, the oil was purified by short silica gel plug (10% DCM in n-hexanes). Solvent was dried in vacuo to afford the 4-octyloxy-3-nitrobenzaldehyde as a slightly colored oil.

Example 11

Testing Procedure

The testing procedure described herein was applicable to malodor counteractant compounds containing water-soluble, modified polymers, oligomers, or surfactants.

A solution of n-butyl amine (nBA) in methanol (0.05% by weight, 500 ppm) was prepared and stored at 0° C. in a refrigerator prior to use. A solution of a malodor counteractant compound to be tested was prepared (50 to 100 mL) with distilled (DI) water and thoroughly mixed with a magnetic stir bar. The nBA solution was added to the solution of the malodor counteractant compound and the molar ratio of the malodor counteractant compound and nBA was adjusted to 1:1. For a polymer-containing malodor counteractant compound, the averaged molecular weight of the polymer was used for this calculation. Water or diethyl phthalate (DEP) containing the same amount of nBA as the test group was used as a control.

For analysis, the aqueous polymer/surfactant (1 mL) was placed into a 20 mL headspace vial using a positive displacement pipette. nBA solution (0.05%, 250 µL) was subse-

16

quently added into the vial. The vial was then capped immediately. The vial was placed in a holder and set on an orbital incubator for a pre-selected mixing/equilibration time. An aliquot of headspace above the reaction solution was then sampled and injected into the gas chromatograph for separation and detection.

Example 12

Evaluation of Malodor Counteractant Compounds with α -Keto Moiety

The ability of α -keto-containing molecules to reduce the amount of amine-based malodor was determined. Water was used as the control. The results are presented in Table 1.

TABLE 1

| α -Keto-Containing Molecules | Malodor Reduction |
|-------------------------------------|-----------------------------------|
| 2-Pentanone | 75% at 1 hour and 83% at 12 hours |
| Ethyl levulinate | 41% at 1 hour and 69% at 12 hours |
| Butyl levulinate | 39% at 1 hour and 62% at 12 hours |
| Octyl levulinate (Compound 6) | 75% at 1 hour and 78% at 12 hours |

The malodor counteracting effect of malodor counteractant compounds containing an α -keto moiety covalently attached to a polymer including PEG-dilevulinate, TETRONIC 701 tetra-levulinate, and TETRONIC 901 tetraluvulinate were evaluated following the testing procedure described as above. The mixing/equilibration time was an hour. DEP was used as the Control. The results are presented in Table 2.

TABLE 2

| Malodor Counteractant Compounds | Malodor Reduction |
|---------------------------------|-------------------|
| PEG-dilevulinate | 4% |
| TETRONIC 701 tetra-levulinate | 97% |
| TETRONIC 901 tetraluvulinate | 75% |

Example 13

Evaluation of Benzaldehyde Malodor Counteractant Compounds

The selective reactivity of nBA with certain small molecule benzaldehydes was determined to demonstrate benzaldehyde reactivity. The results of this analysis are presented in Table 3.

TABLE 3

| Ingredient | nBA reduction (T = I) | nPT reduction (T = I) | nBA reduction (T = +12) | nPT reduction (T = +12) |
|-----------------|-----------------------|-----------------------|-------------------------|-------------------------|
| Acacia | 100.00 | 46.67 | 100.00 | 93.70 |
| Aubepine | 100.00 | 4.47 | | |
| Benzaldehyde | 100.00 | 12.22 | 100.00 | 11.09 |
| Isobutavan | 100.00 | 0.31 | 100.00 | 0.00 |
| Salicylaldehyde | 100.00 | 0.00 | 100.00 | 15.53 |

nBA = n-butylamine,
nPT = 1-propanethiol.
